

We are now experiencing what the majority of scientists around the world have been forecasting as a result of climate change, probably brought about by human actions such as pollution, land clearing, etc. Even if it is not directly human fault, surely it is worth reducing pollution, saving forests, preserving biodiversity for the sake of our children's world and their health - why so many allergies, and other sicknesses now that our parents never saw?

We may have let things go too far already, but please consider that it is still possible to do and whether future generations' health and well-being are not more important than our dividends from mining, forestry, etc.

Margaret Atkinson
