**Subject:** Wind generators drought proofing and Misophonia  
**Date:** Wednesday, 4 February 2015 3:14:54 PM

---

Dear panel

Australia has wasted massive amount of resources on Wind power generators because it rushed into this with a sales pitch that forsook economic and practical reality.

Within this submission I shall out line a far better plan for the practical utility of Wind power.

Later this year when i am ready I will offer to the Australian people an innovative plan that uses Wind and solar to drought proof Australia over a thirty year period.

Because i am quite able to fully articulate this in detail and indeed be questioned on this and provide answers that satisfy beyond politics it is with confidence in this innovation we can move the whole policy within the factor of climates pertinent to Australia into a scientific geographical and economic reality.

This is not about dams dams are a waste of time and effort in many places because as any farmer would know they fill up with silt.

This is a system that uses desal units and available H2O powered by wind so it is natural and as intermittent as the weather it self it is a natural system based in years of gained insight into the geophysics of Australia. and examines the next generation of energy systems.

What I am offering to describe may be not at first within the scope of this inquiry or may be it is. I don't know.

It is about desperately needed employment for low skilled people, investment by Australians in Australia's future and the creation over a very long period a real solution to the climate of Australia.

This will be submitted in time to the Australian people regardless of politics I am not interested in politics it is now beyond the pale. It is Australia's future that is of concern.

As far as low frequency sound is concern the science of this is fully understood and can no longer be denied by wind mill sales people.

20% of people are affected to various degrees by Misophonia there is already enough scientific based evidence done by any number of scientists and engineers to validate a class action against wind mill companies because of the disturbances these cause which may be very traumatic to some even though others have no idea about why. It can well enough be described in enough detail why and how this is so. To deny Misophonia is a fact is simply rubbish talk.

Massive frequency shifts within the audio dynamics within the electric motors of wind generators is well known to anyone who works in heavy industry i suggest the panel investigate heart problems caused by low frequency sound in Sydney railways workshops circa 1920s before denying what is already well established knowledge. Because again that is rubbish talk and we the people have had enough of rubbish talk from wind mill sellers and politics in general..

Low frequency sound acts in many ways through being out of sync with individuals bodily frequency and like waves at the beach that accumulate if they went between two buildings if you watch the Tsunami that hit Thailand you can imagine low frequency waves as such.

This is such a serious environmental factor but is ignored by Greenies and government and health people but already in some countries steps have been made to reduce the impact of low frequency sounds by how generators are sound proofed etc. House hold fridges should be low frequency or banned from sale. Because they disturb sleep in children.

The sort of sound that comes from Wind Mills is silent sound as any dog knows does

not have to be heard by everyone. It will depend on the following factors; the person in the house may be a misophonia sufferer it is a 20% minority group created by evolution. that ought to be considered as having equal rights to any other.

The soils and type of geology the dampness etc and stone houses may be more affected than wooden ones also verandas affect how the sound crashes into a house as it accumulates the inaudible vibration and resonance and that would seriously affect the occupier.

Because what is stated here is actually already verifiable by science regardless it may be poo poed by who lives by the sales pitch alone it is imperative all those who say they are affected by these things are not called dishonest misophonia is a fact.

I have nothing against wind generators it is how we have been bull dozed by politicians into having these things without due diligence to the fiscal system which they are a great loss and without first considering alternative economic models so competition was created in the first instant and they were not subsidised by pensioners power bills.

\ They talk about deficit whilst creating it they talk about employment whilst destroying it they talk about markets whilst perverting the very meaning of this. they talk about a fair go for all and it has no meaning what so ever.

Kind regards

Graham Gordon Thomas
