

Many parts of Australia are experiencing the catastrophic outcomes of extreme weather. These weather patterns will be exacerbated in the future due to the warming of planet earth and the impact on its ecosystems, particularly the oceans.

A number of years ago, the "average" Australian was aware of and concerned about the impact of climate change, however, recent polling suggests that they no longer see the need to tackle climate change as a priority (& there are many reasons for this including the lobbying of big business particularly coal).

However, the recent weather and its impacts have brought climate change to the forefront again (at least for those who make the connection!). It is time to recognise what is happening and take action to try and minimise the future effects of climate change.
