

To Whom It May Concern,

I have an allergic and chemically and foods sensitive child.

Approximately one in six children are being born with allergies , intolerances, sensitivities.(These are US figures and reflect Western diet, lifestyle, prevalence of microwave telecommunications/exposures and mutagenic and carcinogenic exposures typical of so called first world nations.)

Allergic and sensitive children are not medically diagnosed at infancy. Reactions such as rashes, reflux, digestive pain and other early symptoms can be explained diversely.

These children when exposed to vaccines in infancy are far more prone to anaphylaxis, brain damage and other harm.

They cannot speak for themselves or refuse intravenous introduction of toxic or foreign agents which have a higher likelihood of harming them.

Parents, often new parents , are not prepared or informed about allergies, the needs of these children or the risks associated with foods and chemicals. These children can suffer terribly, have debilitated sleep and emotional and developmental disturbances due to their reactions until the causes are identified and removed after which gut rehabilitation is a extended process and may take years.

New gut science and discoveries related to the microbiome in the alimentary canal which determines immunity, intellectual function and psychology etc may shed light on the primitive aspects of current vaccination practices. Certainly they are increasingly dangerous for very young and highly sensitive children.

Clearly we do not have all the science to make blanket decisions about compulsory mass vaccination.

These babies need a voice.

I arguably saved my allergic child's life by refusing vaccination in infancy. I was shamed by medical professionals but in retrospect my courage saved my child as his specific allergies had not been identified in infancy.

Sincerely,

Anna Harpley
