

Submission to the Senate Economics Legislation Committee

Corporations Amendment (Crowd-Sourced Funding) Bill 2016

Dr Marina Nehme
Faculty of Law, University of New South Wales
UNSW Australia
UNSW Sydney NSW 2052

Introduction

This submission is in response to the inquiry that is currently being conducted into the introduction of crowd-sourced funding ('CSF') in Australia. The aim of this submission is to provide an informed debate on the critical issues raised by the Corporations Amendment (Crowd-sourced Funding) Bill 2016 ('The Bill').

If any of the responses require further explanations, please contact Dr Marina Nehme from the University of New South Wales, Australia

General Observations

In line with the approach of other countries such as the United States, United Kingdom, Italy and New Zealand, the Bill proposes three key safeguards to protect investors. These safeguard target the regulation of businesses, intermediaries and investors. This submission will be referring to three proposals: One proposal—referred to in this paper as the CAMAC model—has been put forward by the Corporations and Markets Advisory Committee ('CAMAC').¹ The other proposal—referred to in this paper as the NZ model—is based on the NZ law reforms in this area.² The option put forward by the Bill will be referred to as the Bill model.

¹ CAMAC was established in 1989 to provide the responsible Minister with an independent source of advice on the amendment of the corporations legislation, the operation and administration of that legislation, and the enhancement of financial services laws to ensure their efficiency: <www.camac.gov.au>. Despite the central role CAMAC has played in implementing reforms that have cut red tape and enhanced business efficiency, the Australian government is planning to abolish CAMAC: Australian Securities and Investments Commission Amendment (Corporations and Markets Advisory Committee Abolition) Bill 2014.

² Australian Government, *Crowd-Sourced Equity Funding – Discussion Paper* (December 2014) , 7, <<http://treasury.gov.au/~media/Treasury/Consultations%20and%20Reviews/Consultations/2014/Crowd%20Sourced%20Equity%20Funding/Downloads/PDF/CSEF%20Discussion%20Paper.ashx>>.

The observations made in this submission can be summarised in the following manner:

- Currently the Bill excludes over 99.7% of companies from accessing CSF. Such a reality defeats the purpose for introducing legislation to facilitate CSF as only a very small minority of companies will be able to raise funds through this mode of finance. However, the answer is not removing the cap on proprietary companies or adapting the proprietary company's format to allow for proprietary companies to be able to access CSF. Any consideration of CSF should be accompanied with discussion on how to promote small and medium enterprises, and whether to do so may require the establishment of a new form of company: one that allows entrepreneurs to access CEF when they outgrow a proprietary company, while also providing some protection to investors. Designing such a company form will ensure Australia does not fall behind the rest of the world, and will promote a different type of entrepreneurship. The foundation of such a company can be found to a certain extent in the proposed exempt company put forward by the Bill.
- Businesses should only be allowed to raise money based on milestones present in their business plan. This would raise their accountability as they would have to justify any delays in reaching a milestone to investors before they can raise more funds on the market. Reaching a milestone sends a signal to the market about the viability and potential of the project. It may also lower instances of fraudulent activities and curtail any losses investors may suffer due to a project.
- The regulation imposed on intermediaries is well balanced. However, civil penalties as well as criminal penalties should be introduced to the system.
- ASIC's power should be expanded to ensure ASIC can efficiently regulate this area of the law.
- **Financial literacy** strategies should be attached to CSF. A questionnaire to test investors' understanding of the risks involved with CSF and the factors to consider when investing through CSF, such as signals to look for, would also be beneficial.

Safeguard 1- Business Regulation

One of the safeguards proposed in Australia is the imposition of certain regulations on businesses who are trying to raise capital from the public. This is an important safeguard because there is a risk of fraud and business failure attached to crowdfunding.

a Type of Company- Expanding CSF to Proprietary Companies: Why or Why not?

The vast majority of Australian companies are privately held. There are many advantages for this. Proprietary companies face fewer regulations and lower requirements than public companies when it comes to reporting to shareholders, for example.

But new sources of funding are starting to blur the lines between public and proprietary companies. As a result, we should consider introducing an intermediary form of corporation that sits between the two.

The difference between public and proprietary

Proprietary companies are not designed to raise funds from a large group of shareholders. In fact, two of their key characteristics are that they cannot raise capital from the public and they are limited to having 50 non-employee shareholders.³

This is part of the reason why proprietary companies face fewer regulations – they provide very little protection to shareholders. They are not required to hold an annual general meeting,⁴ for instance, and do not need to provide their shareholders with financial statements or comment on the company’s performance.⁵ Further, a shareholder might find it very difficult to sell their shares in a proprietary company as this may require not only finding a buyer but also getting the board of directors’ approval.⁶

Historically, when a company required more funds than 50 non-employees could provide, they would convert into a public company. Counting on a wider base of investors and owners, public companies are more heavily regulated, addressing many of these concerns.

In comes CSF

A new form of funding has come on the scene – CSF. It allows companies to raise funds from a large range of investors through an online portal. Investors receive shares in the company in return for their investment.

CSF has the potential to bridge the gap between proprietary and public companies: it enables companies to access funds from many investors without going through the traditional fundraising regulation. But the current framework, with restrictions like the prohibition on proprietary companies raising funds from the public, creates a roadblock to accessing this type of finance.⁷

Recognising this, the government introduced a Bill to enshrine CSF in legislation. The Bill limits CSF to a select group of public unlisted companies.

Limiting CSF to public companies does not take into account the important role proprietary companies play in our economy. Hence a review of whether CSF should be extended to proprietary companies is welcomed.

But simply extending CSFs to proprietary companies is not be ideal either.

Why we can’t just extend CSF to proprietary companies?

If the introduction of CSF to proprietary companies is accompanied by raising the ceiling for investors and introducing more accountability in the system, the issue of investor protection will be moot. However, this could mean the death of proprietary companies as we know it. With increased regulation, the cost of running a proprietary company will rise. This type of business may no longer meet the need of people who are currently running closely held companies – which form the bulk of proprietary companies.

⁴ *Corporations Act 2001* (Cth), s 250N

⁵ *Corporations Act 2001* (Cth), s 292.

⁶ *Corporations Act 2001* (Cth), s 1072G.

⁷ Corporations and Markets Advisory Committee, *Crowd Sourced Equity Funding Report* (May 2014).

Further, there is a need to distinguish between two types of proprietary companies – the one that may never be interested in accessing CSF and the one that may in the future. For instance, a proprietary company may be a useful engine to set up new general, social and environmental enterprises as this type of company is cheap and cost effective to run. However, with the growth of such businesses, access to finance may be problematic and conversion to a public company may not be an ideal either. Something in between could be the solution.

A new form of company

Any consideration of CSF should be accompanied with a broader discussion and review of the type of companies that we have in Australia. It is time for a holistic review to take place. An amendment of the system just to ‘fix things up’ is not appropriate.

CSF is appealing for entrepreneurs. However, a number of them rely on proprietary companies to run their enterprise and this limits their access to finance. As such any discussion regarding the **introduction of a new type of company or a new subset of companies** need to consider what type of entity would promote small and medium enterprises, and whether to do so may require the establishment of a new form of company: **One that allows entrepreneurs to access CSF when they outgrow a proprietary company, while also providing some protection to investors.**

Designing such a company form will ensure Australia does not fall behind the rest of the world, and will promote a different type of entrepreneurship.

A start

The Bill put forward what may be viewed as a temporary intermediary form of company – a public company which has limited governance requirements. The company has the following concessions:⁸

- Unlike general public companies, they are not required to hold an annual members’ general meeting for five years;
- They are only required to provide online financial reports to shareholders for a period of five years. No hard copies are required to be sent to the members.
- While public companies have to appoint an auditor within one month of registration, for the first five years, companies eligible for limited governance requirements do not need to do so until they raise more than \$1 million (AUD) from CSF or other offers requiring disclosure.

Although this proposal deals with the shareholders limitation imposed on proprietary companies, there is doubt regarding whether the limited governance imposed on these companies is enough to encourage proprietary company to convert to public company to access CSF. For instance, if the company raises more than \$1 million (AUD), it will have to appoint an auditor. Further, costly continuous obligations under the *Corporations Act 2001* (Cth) will apply as the company will be deemed as unlisted disclosing entities.⁹ Half yearly reports will also then be required to be provided by such companies.¹⁰ Consequently, the current concessions are really minimal and do not necessarily encourage proprietary companies to be converted to a public company as the governance cost remains high.

⁸ Corporations Amendment (Crowd-source Funding) Bill 2016 (Cth), cl 738ZI.

⁹ *Corporations Act 2001* (Cth), ss 111AL, 675.

¹⁰ *Corporations Act 2001* (Cth), s 285, 302.

Further, the nature of the exemption is temporary. There is an assumption that at the end of the specified five year period, a business that attracted crowdfunding as an exempt public company will have the necessary resources to be able to comply with the legislative requirements attached to a public company. However, this may not be the case and, consequently, compulsory conversion to a public company may negatively impact the affairs of the business. Accordingly, it is crucial to get the timing of when such a conversion occurs correct.

As such, this submission recommends an introduction of a permanent new type of company that may adopt the concessions currently proposed to for public companies with limited governance requirements. However, **broader concessions may be needed to ensure that the company does not have continuous disclosure obligation imposed on it for a certain period of time.** This type of company may be further adapted to become a entity that sits between proprietary companies and public companies. It will provide a haven for entrepreneurs once they outgrow the proprietary company format and give them time to build themselves into a more successful company that can then be converted into a public company when a further expansion of the business is needed.

b The Cap

Both the CAMAC and the NZ models impose a cap on investments through CSF. The proposed cap under both models is \$2 million (AUD) in any 12 month period limited to one class of shares – ordinary fully paid shares.¹¹ This cap is appropriate for the following reasons:

- Around the world to date the average amount raised by different types of crowdfunding is less than \$2 million (AUD). For example, in 2014, the average amount that a business raised from Peer to Peer ('P2P') lending was \$103,618 (US). In the case of CSF, the average amount varied from region to region, with averages ranging from \$175,000 (US) in North America to an average of \$342,260 (US) in Asia.¹²
- The \$2 million (AUD) cap is consistent with the seed capital requirement that the majority of start-ups may need.¹³

However, the Bill model ignores both recommendations and introduces a cap of \$5 million (AUD) in any 12 months period. While this cap is supported and promoted by ASSOBS,¹⁴ no justification has been put forward to explain the need to raise the cap to this amount. The cap supported by the CAMAC and NZ models seems more justifiable than the one put forward by the Bill model. In fact, only Italy has adopted a higher cap than the one proposed by the Bill. Most countries have adopted a cap that varies between \$1-2 million.

Accordingly, **a return to the \$2 million cap is recommended.**

¹¹ This cap excludes funds raised under existing prospectus exemptions for wholesale investors. See Australian Government, above n 2, 9.

Safeguard 2- Intermediary Regulation

The second safeguard proposed relates to the regulation of intermediaries. Such regulation is especially important due to the key role online platforms play in bringing together businesses and investors:¹⁵ the intermediary controls which projects go on its platform and which investment opportunities are available to investors. As these platforms play the role of gatekeepers, it is in their best interests to limit fraud and attract successful ventures since poor quality projects would negatively impact their profitability. If an intermediary can develop a reputation as being trustworthy, this would raise investor confidence in the platform and would attract more investors to it as they would trust the platform to promote viable projects.¹⁶

a Importance of the Intermediary

Although there are intrinsic and extrinsic motivations for an intermediary to closely monitor the projects it promotes, it is important to regulate these online platforms to safeguard investors. A close look at existing platforms reveals a lack of transparency in relation to failed ventures: instead, intermediaries only promote their successful projects. This may be misleading to the average investor.

Further, the majority of intermediaries have not been generating any profit, which means that they are at risk of failure.¹⁷ The collapse of an online platform may result in the loss of data or contracts entered into between investors and businesses and may cause investors to lose their investments. For example, in 2011 P2P lending platform Quakle closed, leaving investors with few remedies to recover their investments.¹⁸ As such, it is important for an intermediary to have a data retention system that will continue to make all information available even if the platform fails. Further, clients' funding should go into a separate account. This would ensure that invested funds are protected if the platform collapses.

b Licence Requirement

In view of the role that online platforms play in the process of CSF, both the CAMAC and the NZ models require intermediaries to be licensed.¹⁹ This would permit ASIC to monitor each online platform and ensure that the conditions of its licence are met. Due to the nature of the intermediary, there are two possible existing licences that might apply:

- an Australian financial services licence (AFSL);²⁰ and
- an Australian market licence (AML).²¹

¹⁸ Rupert Jones, 'Quakle Collapse Serves as Warning to Peer-to-Peer Investors' *The Guardian* (15 February 2014, Online) <<http://www.theguardian.com/money/2014/feb/15/quakle-collapse-warning-peer-to-peer-investors>>.

¹⁹ Australian Government, above n 2, 9.

²⁰ An Australian financial services licence is required if a person is running a financial services business, *Corporations Act 2001* (Cth), s 911A.

²¹ An Australian market licence is needed if a person is operating a financial market, *Corporations Act 2001* (Cth), s 791A.

The Bill model requires intermediaries to hold a new type of AFSL that expressly authorises the provision of crowd-funding services.²² This approach makes sense and is to be commended. Applying for this licence is both more straightforward and less costly than applying for an AML. An AFSL would also present fewer entry barriers to intermediaries since such a licence is issued by ASIC if the legislative requirements are met,²³ while an Australian market licence may only be issued at the discretion of the relevant Minister.²⁴ Further, an Australian financial services licence would provide investors with a range of protections,²⁵ including the establishment of compensation arrangements²⁶ and internal and external dispute resolution processes.²⁷

Additionally, under both the CAMAC and the NZ models the intermediary is required to conduct limited due diligence checks on businesses that are raising capital on its platform, and may not provide financial advice regarding any investment. Instead they are to provide a generic risk warning to investors.²⁸ The Bill model adopts a similar approach by referring to the intermediary as a gatekeeper.²⁹ The due diligence requirement will help reduce the risk of fraud,³⁰ while the generic risk warning requirement will highlight to investors the risks their investment may involve. Under the Bill, the intermediary will be required to conduct prescribed checks and must not publish information about a company if it is not satisfied as to the identity of the company, its directors and officers.³¹ **While these obligations may be costly, they are essential to ensure the protection of investors and enhance the corporate governance of the intermediary.**

c Penalty Regime

While the CAMAC and NZ models are silent on the matter of penalty regime, the Bill model notes that any breach by the intermediaries of its obligations regarding the CSF offer may result in criminal action. The proposed penalties are a maximum 60 penalty units and/or one year imprisonment.³² While this may send a message that the obligations imposed on intermediaries are very important, the amount of the fine imposed is low and should be raised. Further, the chances of such action being taken are minimal. **Civil penalty regime should be introduced in the context of these specific obligations.** This will ensure that the regulator has a range of enforcement tools at its disposal to deal with the breach.

However, it is important to acknowledge that the regulator has currently other tools at its disposal to deal with these breaches of licence obligation. Under the *Australian Securities and Investments Act 2001* (Cth), ASIC has the power to enter into enforceable undertakings to deal with any breach of the law. Enforceable undertakings can be described as a promise

enforceable in court.³³ It takes the form of a settlement in which the alleged offender (who may be called ‘the promisor’) and ASIC start negotiations in relation to the alleged breach of the law and reach a compromise to deal with that alleged breach. The benefit of an enforceable undertaking is that it attempts to prevent similar breaches of the law from occurring in the future. It further will allow both the regulator and the intermediary to develop an understanding best practices regarding compliance with the law in this area.

Safeguard 3- Investors’ Regulation

The third safeguard proposed relates to imposing regulation on investors. A review of the different approaches adopted or lobbied for around the world indicates that the level of obligations imposed on investors varies, with some countries adopting very few limitations on investors while others have more restrictive rules that curtail investors’ freedom. For instance, New Zealand allows investors to invest in CSF as long as they have signed a document acknowledging the risk that this form of finance involves.³⁴ Italy goes one step further by requiring investors to complete a questionnaire to ensure that they understand the risks attached to CSF.³⁵ However, the most popular model, adopted in countries such as the US³⁶ and the UK,³⁷ is very restrictive as it imposes a cap on the CSF investments that a person can make in a period of 12 months.

a The Cap

In Australia, the CAMAC model would only allow a person to invest \$2,500 (AUD) in any one business in a 12 month period, with a maximum of \$10,000 (AUD) to be invested in CSF during that period.³⁸ This proposal is more rigid than the NZ model, which does not have any compulsory investment caps attached to it.³⁹ Further, the total cap on investments in CSF proposed by the CAMAC model is much lower and less flexible than the caps adopted in countries such as the UK⁴⁰ and the US⁴¹ and as such had little appeal. The Bill model proposes a waterdown cap which is aimed to protect investors while giving them the choice and the right to invest their money as they wish. A \$10,000 (AUD) cap per investor in a period of 12 months (with the possibility of altering this cap by regulation) is introduced.⁴² However, this cap is qualified as it is the maximum amount that can be raised by an individual on one platform and in the same company. **This does encourage investors to diversify their investments and will allow them to invest in other companies if they wish to do so.**

³⁹ Australian Government, above n 2, 10.

⁴⁰ See Financial Conduct Authority, *Conduct of Business Sourcebook* (COBS) 4.7.10: the investor should not invest more than 10% of their net assets in non-readily realisable securities in a period of 12 months.

⁴¹ See *JOBS Act*, s 302: the aggregate amount sold to an investor does not exceed the greater of \$2,000 or 5% of the annual income or net worth of the investor if their annual income or their net worth is less than \$100,000 or 10% of their annual income or net worth (to a maximum of \$100,000) if the annual income or the net worth of the investor is equal or more than \$100,000.

⁴² Corporations Amendment (Crowd-source Funding) Bill 2016 (Cth), cl 738ZC.

b The Nudge

The imposition of investment caps stems from the nudge theory. This theory seeks to enhance the understanding and management of heuristic influences on human behaviour which affects the decision-making of individuals. With this understanding, it aims to reshape existing choices of individuals through choice architecture.⁴³ The investment caps recommended by the CAMAC model are designed to change behaviour by limiting the number of businesses individuals can invest in. The fact that there is a limitation is intended to stop a person from rushing into any particular investment and instead make them reflect on whether such an investment is possible or whether they should save their funds and invest it in other, more promising businesses.⁴⁴ Curtailing investment choices through caps is a paternalistic approach to CSF and may go beyond the liberal paternalism promoted by the nudge.⁴⁵

However, applying such a paternalistic approach may be not only justified but warranted, as people's decision-making is not generally clever or logical and a herd mentality may apply.⁴⁶ These deficiencies are likely to be accentuated in an online environment where investors may be trading more actively and speculatively.⁴⁷ With CSF and financial markets in general, history has demonstrated that there is a seemingly irresistible movement of the crowd toward bad investments, with investors being 'sucked into the vortex of the market whirlpool'.⁴⁸ Some may even say that the crowd is destructive, impulsive and will exhibit a new persona separate from its members as the individual consciousness vanishes from the crowd.⁴⁹ The crowd is then perceived as a single being and 'is subjected to the law of the mental unity of the crowd'.⁵⁰ As a result of this, the crowd is viewed as irrational, and this characteristic would be dangerous in the case of CSF where fraud and business failure may become rife.

More recent research, however, suggests that the crowd may not be irrational.⁵¹ For instance, the rush toward bad investments in the past may not have been conducted by an irrational crowd. The crowd may have had promising leads and motivations and reasons that guided them to particular investments.⁵² Additionally, a crowd may be wise.⁵³ The aggregate judgment of the crowd is more accurate than the judgment of individuals.⁵⁴ Aristotle, for instance, noted that when people come together, 'they may surpass – collectively and as a body, although not individually – the quality of the few best ... When there are many who contribute to the process of deliberation, each can bring his share of goodness and moral

⁵⁴ Francis Galton, 'The Ballot-Box' (1907) 75 *Nature* 509.

prudence; ... some appreciate one part, some another, and all together appreciate all'.⁵⁵ With crowdsourcing, for example, the crowd has been able to provide more original and superior problem-solving outcomes.⁵⁶ Individuals involved in crowdsourcing are motivated by extrinsic and intrinsic factors to make a contribution to a particular project.⁵⁷ The technology now allows for millions of independent ideas to come together without the danger of too many compromises being made by individuals in the crowd.⁵⁸

Further, with CSF, a range of people will be coming together from different backgrounds with different knowledge and experience and that may make the crowd wiser.⁵⁹ The more diverse a group is, the better it is at solving problems, as each member of the group will be bringing new information which will enhance its decision-making in the end.⁶⁰ Homogeneous groups, on the other hand, are often victims of 'group think':⁶¹ their mental efficiency and moral judgment are influenced by in-group pressure which may lead to the deterioration of decision-making.⁶² Accordingly, the diversity of people that will be attracted to CSF may result in better outcomes for investors.

Of course, this does not mean that people will always make good decisions when investing in SMEs through CSF, as there is always the danger that the crowd may become polarised and homogeneous.⁶³ Further, some investors may be investing as a result of a hyped-up project without considering the value of the project properly. As such, investor-targeted protections need to be in place. However, such protections do not need to adopt the paternalistic approach of the investment cap. The approach to investor regulation proposed by CAMAC is also problematic from an enforcement perspective: **who will enforce the caps?** To require the intermediary to ensure that investors on their platform are in compliance with the cap may be costly for the intermediary. Further, **if this responsibility is placed on the intermediary and an investor breaches the cap, what penalties will then apply?** The imposition of penalties may be a draconian approach to protecting investors. It may even go against the national mood that has been supportive of CSF. A different solution, that would provide protections to investors while promoting their interest in investments, may be needed instead. **As such the fact that the Bill model loosens the limitation on investors is welcomed as the cap imposed will still allow investors to diversify their investments via CSF while also providing the intermediaries with a rule that they can easily implement. If they find that an investor is investing more than \$10,000 (AUD) in the same company, the intermediary can easily stop that transaction from going forward.**

c Promoting Financial Literacy

It is suggested that CSF may be viewed as a social experiment to boost financial literacy.⁶⁴ Financial literacy is very important as it can develop and promote individuals' autonomy of choice: it will open the door for the average person investing in CSF to be treated as a free rational being and would prevent the CSF exemption from sliding into overbearing paternalism.⁶⁵ People who are becoming interested in investment will be self-motivated to learn how to enhance their decision-making in this area. A culture that enables them to find out what they need to know will lead to better decision-making of the crowd. It is important to allow people to adopt the right norms and practices in their investments.⁶⁶ One key element an education campaign to boost financial literacy should highlight to investors is the fact that there are a number of signals that ought to be considered when investing in CSF. These signals provide information regarding a project's viability and so may enhance the decision-making of investors.⁶⁷ In addition to the traditional signals referred to in the literature of crowdfunding,⁶⁸ it is suggested that regulation to protect investors could add one more signal which would lower the information asymmetry between a business and investors:⁶⁹ **businesses attempting to raise more than \$100,000 (AUD) in one go should only be able to do so if they raise the funds in stages. Each stage would be a milestone which, when reached, would allow the business to raise more money to achieve the next milestone in the project.** This would provide additional information to investors regarding their initial investment: is the business meeting its milestones on time? If it is, it may attract more investors or encourage existing investors to increase their stake in the company. On the other hand, if milestones are not met, questions will be raised regarding the reasons behind the delay. Evidence of delays may deter new investors from investing in the business. Such milestones may limit fraudulent activities in the sphere of CSF and may also limit the losses of investors.

This education campaign to boost financial literacy could be conducted jointly by ASIC, as part of its financial literacy program, and the intermediaries in CSF, since they play a gatekeeper role between businesses and investors. In addition, an approach similar to the Italian system might be adopted, so that investors are required to complete a questionnaire demonstrating their understanding of the risks and the factors to consider when investing in CSF. It is to be hoped this will raise investors' awareness of investments in general and so enhance financial literacy. This is important as it may also impact how investors perceive their superannuation.

d Investors' Protection

Lastly, investors still need a regulatory policy that protects their interests. This is particularly important since CSF is relied on when SMEs wish to raise a small amount of money from a large pool of investors. In instances where misleading or fraudulent conduct by businesses or intermediaries occurs, investors have few resources available to them: it is unlikely that individual investors would have invested enough money in a project to justify bringing a legal action against the business or the intermediary. A class action may also be unlikely as the gains for lawyers running such a case are limited.⁷⁰ Consequently, ASIC must take an active role in monitoring and regulating CSF. Actions and initiatives similar to those of the Attorney General in Washington State and the US Federal Trade Commission may be necessary to send a message to businesses that they will be held accountable if they are involved in misleading or fraudulent conduct through CSF, irrespective of the fact that the losses to individual investors may be relatively small.

However, from the regulator's perspective this may be problematic, as ASIC has a limited budget. Accordingly, the full-scale audit of ASIC that is currently taking place⁷¹ should consider improving the regulator's budget to enable it to achieve its objectives in protecting consumers, even in the CSF sphere. ASIC should additionally be equipped with administrative enforcement powers that would allow it to act quickly to stop a fraudulent scheme from taking place. To provide ASIC with intervention powers may also be desirable. Such powers would allow the regulator to stop the promotion of a particular product or business venture if ASIC believed there is a high risk of fraud or deception in the product.⁷² This power would allow ASIC to act to protect consumers without having to prove that a breach of the law has occurred.⁷³

Conclusion

CSF is a social phenomenon. Through its use of social media, it has attracted people who have previously never been interested in investing in companies. Instead of being feared, this interest should be nurtured through the promotion of investors' financial education. **A questionnaire to test investors' understanding of the risks involved with CSF and the factors to consider when investing through CSF, such as signals to look for, would also be beneficial.** To rely on caps on investors is too restrictive and may stunt the development of CSF in Australia. It is further problematic as such caps are not only paternalistic but go

⁷² The Financial System Inquiry conducted in 2014 recommended that ASIC should have product intervention orders at its disposal: see Commonwealth of Australia, *Financial System Inquiry – Interim Report* (July 2014), Recommendation 22, 206.

⁷³ For a discussion on product intervention powers, see Dimity Kingsford Smith and Marina Nehme, 'Product Intervention Powers: A Legal, Comparative and Policy Analysis' (2015) <http://www.treasury.gov.au/~media/Treasury/Consultations%20and%20Reviews/Consultations/2014/Financial%20System%20Inquiry%20Final%20Report/Submissions/PDF/Kingsford_Smith_Dimity_and_Nehme_Marina.ashx>.

against the national mood which is supportive of CSF. Issues regarding monitoring and enforcing the caps would also be raised.

To enhance the protection of investors, ASIC should take an active role in monitoring CSF and be willing to sue in case of fraudulent action. Further, if ASIC believes that a project should be withdrawn due to possible fraudulent activities attached to the venture, the regulator should be provided with tools that would allow it to stop CSF of the project from proceeding. Equipping the regulator with additional intervention powers may be a possibility.

As the gatekeeper between businesses and investors, the intermediary online platform should have a financial services licence with limited duty of care. Conflicts of interest that may arise for the intermediary as a result of CSF should be banned. One exception can be made and it relates to the fee structure of the platform. The intermediary's fee structure should be disclosed to investors to highlight any conflicts of interest that may exist.

For businesses, it is important for the government **to review the type of companies that we have in Australia.** It is time for a holistic review to take place. CSF is appealing for entrepreneurs. **A new type of company needs to be introduced.** The new type has to allow entrepreneurs to access CSF when they outgrow a proprietary company, while also providing some protection to investors. Designing such a company will ensure Australia does not fall behind the rest of the world, and will promote a different type of entrepreneurship.

Further, limiting the amount that may be raised through CSF to a cap of \$2 million (AUD) in a 12 month period seems more reasonable and justifiable than a \$5 million (AUD) cap. However, businesses should only be allowed to raise amounts that are more than \$100,000 (AUD) through stages to send a signal to the market about the viability and potential of the project. Including these limitations in the CSF exemption to the fundraising provisions will promote this form of finance and may actually make it a source of capital to SMEs while providing the necessary protection to investors.
