

I am a 42 yr old female with chronic fibromyalgia and pacu immune vasculitis I suffer full body chronic pain and tissue pain my medication is oxycontin which has many side effects and is ineffective after years of taking also has many bad side effects also I'm taken by ambulance alot to hospital as im unable to get my pain levels down I been using medical cannabis oil orally for approx 2 months have found it extremely effective with no side effects. I have no Idea why medical cannabis is not given instead of highly addictive narcotic pain killers that have extremely bad side effects medical cannabis is a natural plant and oxycontin is full of toxic chemicals which in some cases rehab is need to get of the nasty drug. After many years on oxycontin they are less and less effective and so far no trips to the hospital which is a plus for everyone. Please consider the use of medical cannabis oil instead of these nasty narcotic drugs as its way more effective no side effects or addiction.

Thank you
