

As global warming increases the frequency and intensity of extreme weather events, I am unable to ignore the worsening consequences currently affecting our nation. My home is a seaside town high in seafood production and agriculture and is prone to cyclone activity. It is obvious that predicted sea level rise along with increased weather events will have increasingly negative impacts not only on these but on the very services and infrastructure that our survival has become dependant upon eg: power, water, transport etc. The sense of urgency with which I feel this conundrum must be addressed cannot be over emphasised
