

Please take actions so that Australia reduces its CO2 emissions

I'm sure the nation should try to do a bit better than the 5% reduction that the present Government has agreed to.

However, regardless of this, there are practical steps that householders would appreciate. Here is one suggestion: Plenty of us have aging solar hws.

They present rules on "tempering of the hws" have resulted in unnecessarily complex solar hws on the market, and it is important for the world to realize that simpler ones work fine.

It would be really nice to have slightly subsidised repair work, e.g. a government backed insurance scheme to help with maintenance costs.

I'm sure that the single most important household measure to reduce CO2 emissions is solar hws.

Regards,

Grant Keady
