Dear Senators,

Re: Renewable Power

We know these things.

- We need good food, clean water and clean power
- We have a planet that is being trashed by people not husbanding the earth, and profiteers deliberately creating shortages and similar.
- We need a planet to live on.
- There are almost limitless resources, particularly if we use them appropriately.

If we look at the world, we can see the planet being destroyed by people attempting to make more money. From the destruction of the forests (our lungs, effectively) to the pollution of our food and water, and the destruction of renewable seeds through Genetic Modification. All these activities are being driven by the desire to make more profits.

What many of us don't know is that money is made by the banks - that gold and silver do NOT back up money systems, and that banks can make as much money as they want. Including the Reserve Bank of Australia.

So, a reasonable question then becomes - what is profit? If banks create money from nothing, then is chasing after profits at the expense of the planet really worth while? Or if it is going to kill us? I think most people would say not.

I am not saying that money is useless. What I am saying is that the planet's survival is priceless. Absolutely priceless.

What can we do?

Renewable energy is exactly that. Once we have paid for it, we don't have to keep on and on paying for it. And because it is pure and clean, neither does anyone else have to pay and pay for it to be cleaned up.

It is a win/win situation.

And once we start on the process, then we can use that renewable energy to create more devices that need energy to create them. and, we do it cleanly. And the whole world becomes cleaner, and better for us all to live on.

And who pays for it, you may ask? Well, Telstra, the Post Office (PMG) and so on were all built using money created for the purpose by the Reserve Bank and the Commonwealth Development banks. We can do it again, for the good of all Australians, and by example, the world..

Once we have the proper infrastructure set up, and clean energy is available, then we can think how best to develop both ourselves and the country. But it must be financed through the National Bank, otherwise the private banks will cost far, far too much. It might even be impossible. Correctly created money allows us to transfer energies inexpensively. And we need energy (both people's and working energy) to convert sand and other abundant and free materials into solar energy, be it for heat, or as solar cells for electricity.

And so:

- Regardless of whether the sun or man is heating the planet, we need to agree that we need to clean up the pollution.
- We need to agree that we can afford to do it.
- We need to set up a National Bank to fund it.
- And - do it. For our sakes, our children's sakes and the generations to follow.

Yours sincerely,

Clement Clarke
